

# Soil Install Thoughts

Just wanted to write down some thoughts on the FLR and FAR soil probe installations.

FLR:

Soil was very loose. Tried to get probes in their respectable places, but cannot guarantee with such loose soil (sand). I did put in single probe horizontal and did not realize the angle of install on old single probe temperature. Very windy down there with loose soil I was worried about erosion and exposure of probes at the end of this project.

FAR:

All seemed okay on install. More stable sand but was still loose. Single temperature probe was installed horizontally.
