

Cycled power on rsw02

rsw02 is the PC104 Titan DSM which is only samples a Setra analog pressure sensor. It went down about 9 May 05:30 UTC, so I cycled power on it using 'pio aux' on rsw02x. It's back up now and sampling pressure at 20 Hz.

...Actually, it only stayed up for a few minutes and then stopped again, so I cycled power a second time. The problem appears to be related to Diamond A/D interrupts (same as in [ISFS-149?](#)), but I have not investigated any further. rsw02 seemed to stable for a long time, so I wonder what changed.
