

Daily Status Mon 2012-Oct-23

Weather:

Nice crisp and cool morning. Temps hovering around 8C with humidities in the upper 60%.

Status:

All stations are communicating via bluetooth and wifi.

Station 6 down on arrival by Cockpit. Had trouble logging into the dsm but it finally logged me in. I did a 'adn' then 'aup' to see if I could get the system talking again. Extremely slloooooowwwwwww communications with Ah6. The 'aup' did not work. I do see sensors alive in Minicom though. Giving Ah6 a reboot to see if things begin to work.

I did see if the head of the M21, 10m sonic was loose but it was not.

Gave a tour to EOL Admins today.

I do want to add that the base trailer has been neglected this project and I am very dissapointed that it got to this condition. We all need to do a better job in getting organized and vacuuming the carpet. This will make the trailer last a lot longer and make attitudes a lot better.

Sensors and Issues:

All sensors look good but Ah6 due to no data coming down the pipeline.

To Dos:

Ah6 needs help. Fixed trh's in base. Try to figure out what probes that are found laying around that are good. Organize base for show-and-tell today and tomorrow.
