

Daily Status Fri 2012-Oct-26

Weather:

Got about 3.0" of snow making for a beautiful day. Not much of a wind and the house stayed warm.

Status:

All systems look great. Fans seemed to take this snow a lot better than the first round. All optical sensors seem to have low signals so I will take a gander at their condition this morning.

Morning Update: Cleaned all Kryptons, Licors and radiometers. After cleaning 10m Krypton, no change to signal level. I thought I cleared off all snow and cleaning water...we may want to keep an eye on this sensor. The reason I could do the Krypton cleaning is RAL has a snow depth scientist doing measurements today, so he was around to dial 9-1...

I also knocked off snow on some of the solar panels. I will not do that for the rest of the sites. The sun is trying to pop it's head through, so I will let Mother Nature do her thing.

ToDo:

Clean all optic sensors (Licor, Krypton and radiation). Krypton cleaning will depend on a sighter back at the compound. If no sighter, then no cleaning Kryptons.

I will also switch out PockeTecs before leaving.
