

some snow

From the storm yesterday (10 Nov), most of the site is covered with snow. The coverage ranges from a clear ice glaze (that probably melted and refroze today) to drifts of up to 8cm. (Larry says that he found drifts of more than 20cm near the crests of the hills.) Caution for snow-covered holes again! (Once I found a clear path, I tried to walk along my footprints on the return journey.)

I did look carefully at the radiometers and LiCors. From the winds today (often 10m/s), all traces of snow had been blown away and optics looked perfect. Thus, I didn't attempt to clean anything. Kryptons are both reading $> 2V$, so they are fine.
