

Rad Mote outage

RadMote / radiometers outage 6Jul13 ~23:00 local - 7Jul ~11:00 local wi

The mote leds indicated that it was still running and the battery was ok; 12.4. I power cycled it and there was a normal startup. It appears the the local data storage chip is installed, but no gps so recovering the data is basically impossible.

TsoilB mote battery swapped. Shortly before the above the 11.3v battery was removed and a 12.8v one installed. It's possible that the rad mote is routing through the tsoilB radio similar to tsoilA2? Need to test for this.
