

Loaning backup solar panels to Norbert

Norbert (German research group) has a scintillometer above the rim tower site powered by two 100 amp deep cycle gell cell batteries, but has no charging system other than hauling a generator up to the remote site. He has asked if the spare (backup) panels are available to be placed up near their site to facilitate charging. Norbert has been made aware that these are ISFS spares, and if any need arises, he must immediately return these to the trailer for ISFS use. Tom and Gordon have agreed to the loan, and I will help Norbert relocate and install these on Tuesday. He is also going to borrow a spare cooler and charge controller. Please be sure to retrieve these at end of project!
