

449 stopped

The 449 profiler had a critical error on Nagios this morning, and the onsite investigation revealed the DRX program had stopped. The Dashboard showed the DRX program had stopped (red "STOP") but showed the products and status as "running".

The pertinent text in the output of the DRX is as follows.

This first block of output is **NORMAL**. This was the last section of normal data prior to the error, ending at 07:55:00.

Scroll down below to find **ABNORMAL** output block, This was the first section of abnormal data, starting at 07:55:06.

This output continued for quite some time before I stopped and restarted the DRX program at roughly 19:00 UTC.

Hope this is useful in debug.

Thanks,

Tim
