

Afternoon update of daily summary

Checked the other trailers and the data feeds associated with the instruments at that site.

Nagios shows all green lights

Visual check of instruments - all okay

Inspection of the sodar - okay. Battery show charged to 97%

Visited the windcube lidar near the visitor center. The data cable from the WXT was disconnected. Tim reconnected and secured the cable. This fixed three errors that were showing up on the Nagios page: namely those related to the latency of updates from the sensor, and those pertaining to the nidas_1_10 and nidas_1_11
