

radiosonde launched for 449 comparison data

At approximately 12:30pm local time Phil and Tim launched a radiosonde from the barTbar road, just NE of the 449 trailer location. Phil noted an interesting wind shift difference over the profiler, with lower level winds shifting from SW to NE at higher elevations. The balloon was intentionally under inflated to keep the sonde ascending as slowly as possible throughout the lower boundary layer area before and after the wind shift.
