

18 OCT 2013 daily report

Sunny and breezy today

.104mW profiler power lower than normal

IOP #4 for today has been moved to tomorrow.

when I came in there were 2 old unknown errors that are still there but we have several new ones.

[fs_/scr](#) has a warning issue. I just need to know what this is and where to look and fix if possible

[metcraxii/profiler_anyfail_profiler](#) is critical for over 22 hours.

[NTP Time](#) just went critical while I was checking the site.

One other went critical now is good. NTP

I will be climbing the near tower for ISFS to replace a WXT

I need info to possibly fix the new problems.

Will go and check the other sites soon.
