

S8 back on the network

Quick run to the swamp (since able to go under the bridge) to S8. Station was up and had collected data with no problems, just couldn't ping. Couldn't read the modem LEDs due to position with respect to USB stick. (We should swap these positions sometime.) Tried unplugging and replugging in modem with no change. Ended up rebooting – data gap from 0934-0936. Now all is well.
