## **Daily status 9 Oct**

Summary: Rain ended at 1330, after dumping 3.6" during the last 24hrs. Strong, gusty winds - 15m/s at 3m; 25m/s at 49m.

Actions past 24 hours:

- Kate now in Delaware
- barolo stayed down after systems work yesterday until 1340 -- plots/tables now being regenerated.

To dos:

- All actions waiting for wind to die down to less extreme levels
- Reshoot boom angles at 60m and CSAT S8 and S15 We've set up the binos on a tripod.
- Soil core at S1, a second at S15
- Install and "manually" read another TP01. Could be left running at a station hard-wired to a serial port (just made cable for this task).
  Install EC150 at S13. We've checked that it is ready to go.

## Station Status: All up.

## Sensor Status:

T/RH: 42m Ifan has come back, but we don't completely trust that fan is working again (after being dead for many days). Others okay (note that \$1,2,9,10 are wired not to report Ifan).

P: ok 2D Gill: ok csat u,v: ok csat Idiag: ok csat w, tc: went wonky during rain today, as expected 3D RMY: Heavily spiking during rain, came back when rain stopped EC150: usual problems during rain motes: ok Wetness: ok radiation: ok Tsoil: ok Gsoil: ok Qsoil: ok Cvsoil: Ready to manually read sensor Rainr: ok, reported about 1/4" today. Vbatt: ok, manually read Vbatt.tower in afternoon at 12.6V, which is fine (despite the rain/clouds).
