Cockpit ready to test on large display

The latest cockpit has been installed on eddy and is ready for testing on the large display. At the moment, we do not know the location of the stand or the long 12' HDMI cable, nor do we know where it should end up. Once those are figured out (or a new cable purchased), we should be able to get it working with eddy same as at VERTEX. eddy has a wire ethernet connection to the ASUS wireless bridge, so it should be possible to move eddy anywhere to be near the location of the display. I think it would also work to set the eddy wireless interface to the same static IP as the wired interface, so long as it is on the tower network (SSID perdigao and not CSCR).

Details on the VERTEX installation, such as desktop configuration for the second display, are in ISFS-113.
