

Data look okay

Didn't do a complete look at everything, but did look at perhaps half of the variables, both with ncharts and dashboard today. Everything looked fine, though a few notes:

- The sonics didn't appreciate the weekend's rain, with several level shifts
- Even so, the sonic tc values have some biases with respect to their colocated TRH's. Made me wonder if we could characterize these biases by serial number, not just array position, to track them through different projects...
- The batteries look like they <finally> charged up about 11AM today
- The EC150 barometers (Pirga) have biases of a few mb with respect to each other and with respect to the (one) nanobarometer
- The EC150 thermometers (Tirga) have a radiation error of up to 2 degrees. The error only tracks Rsw.in less than half the time, but likely also depends on wind speed (that I didn't look at).

None of this is especially surprising...
