

Status 21 Feb

The forecasted snow did come, starting about 5AM and continuing off and on through the day. Accumulation about 2".

Spent the day touring with Terry and later Erik and Sebastian:

- ISS1: Bill showed us his site
- DCS
- Balloon site
 - brushed off snow from Sebastian's Apogee
 - shifted tethersonde back to its donut and brushed off some snow
- SH (then ate lunch at the SH grill)
 - sonic is tilted down – I'm guessing that my shim washer slipped out. We should check the time history of tilts
- ISFS base, where we met up with E&S, who had never seen some of the satellite sites...
- DC
 - noticed a drip of water off the top EC150 window
- CC
- LC
 - cleaned bird doo from Rsw.in
- SP
 - entire sonic boom also leaning. In part because of the T-stake being broken on the opposite guy, so there isn't as much tension. Again, look at tilts
- MW
- drove past the base of MH
- Back to ISS1, where Bill was cleaning off snow
