

# Site wslope reflagging and soil moving

At site, perhaps 1145-1300. Rain less, but turned to cold fog.

Chose to move from last night's location since Tom and I couldn't figure out how to interpret data over a combo of sagebrush and tilled field. Dave contacted landowner and told anywhere in the stubble field was okay.

New tower site chosen in middle of wheat stubble field to minimize effect of 3m deep x 30m wide gulley to south and high mound to north. Rad stand still to SSW of tower. Despite discussions at the previous site6 location concerning the sonic height, IT WILL BE 3m AS ORIGINALLY PLANNED AT THIS SITE.

Soil black, sticky, globular (like site 4). Again, couldn't (re)test these sensors.
