

Site abc flagging and soil install

At site about 1400-1500. Lots of standing water. Need a hard hat and should check in at office trailer.

Tower site placed near E fence in NE corner on gravel. A bit of a notch between buildings for N winds and relatively open to S. Told not to worry about E winds, so plan on tower dropping to W. Rad stand placed out more in the gravel to give better exposure. Would be nice to set this stand as low as possible to minimize vegetation in field of view.

Soil was wet, sticky, black, relatively large granuals with a few stones (and worms!). Actually not too bad to work in. Placed near solar panel location. Again, couldn't test sensors.
