Checking station cellular status

Dynamic DNS

Immediately after the cellular modem connects to the Verizon ISP, the station registers itself with the dynamic name service, dyndns.com.

So, a good remote check on whether the cellular modem and router are working is to login to our account at http://dyndns.com and check the times of the host registrations.

Ask Gordon, Ling or Gary for our account name and password at dyndns.com.

Once you're logged in, click on the **My Hosts** link. You will see the 7 isfs stations, and two spares, along with the iss systems. The time (MST) that a station last registered with dyndns is shown. Click on **Host Update Logs** to see a listing of all recent registrations.

ping

Each of the stations should also be reachable via ping:

```
ping isfs1.dyndns.org
```
