

ncar1 up

Jun 29, 13:30 CDT

Kurt is at site 1 and phoned to report that system is up. The mast was still down, he will raise it shortly.

TWH: data show mast up at 13:55

I logged in and all looks good - all sensors reporting (except a problem with 2m TRH, see below), including leaf wetness, and flash drive is being written to.

sonic: 537
licor: 1167
prop: 315, propeller: 48627
barometer: B2
2m: TRH17
10m: TRH21

Actually on further inspection the 2m TRH was reporting garbage, with rserial reporting wacky hex values in the middle of the ASCII data. I powered it down and back up with eio:

```
eio 5 0  
eio 5 1  
rs 5
```

After that the rserial output looked good.
